Design a bouquet preview app for a trendy florist.

Idris Bakare

Google

Project overview

The product:

Custom flower delivery app designed to help users create personalized bouquets step-by-step. The target users are busy professionals and thoughtful gift-givers who want to send meaningful, customized arrangements but often feel overwhelmed by the complexity of traditional florist websites.

Project duration:

October 2025 – January 2026

Preview of selected polished designs.

My role:

Lead UX designer,
UX researcher

Responsibilities:

- Conducting user research
- Paper and digital wireframing
- Low- and high-fidelity prototyping
- Conducting usability studies
- Accounting for accessibility
- Iterating on designs

Google

Understanding the user

- User research
- Personas
- Problem statements
- User journey maps

Google

User research: summary

Caroline: Trust & Transparency

- Focus on building trust with clients.
- Suggests adding notes to orders.
- Desires transparency features like face-to-face video calls.

Bradley: Efficiency & Scale

- Gauged on stock quantity.
- Needs the app to be user-friendly for stakeholders.
- Focus on efficient navigation for large orders.

The research highlights the need to balance personalized trust-building features for clients like Caroline with robust, user-friendly inventory management for stakeholders like Bradley.

Persona: Caroline

"We need to start profiting from our hard work; times have changed."

Goals

- Creating an app to showcase their stock
- Brand Awareness

Frustrations

- Time-consuming
- Lack of knowledge
- Cost
- Concerned about flower freshness
- Exact flower placements of each order

Age: 65 years old
Education: A levels
Hometown: London
Family: Married, 2 children
Occupation: Florist Owner

Caroline has been running her allotment for 25 years and has become very popular with the locals. Caroline's business started off as a nonprofit organization; however, due to the economy, she and her husband have now decided to become a profitable business. They want to get with the times and create a bouquet app.

User research: pain points

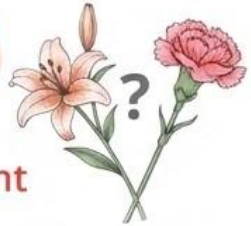
1

Pain point

Flower freshness concerns

2

Pain point



Unclear substitution policies

3

Pain point

Lack of trust and transparency .

4

Pain point

Uncertainty on Final product appearance

The research revealed that users need more than just visual accuracy. They crave transparency and trust throughout the purchasing journey, from sourcing to substitution policies. Moving forward, our designs will focus on building confidence through clear communication features. These will include freshness guarantees, flexible customization options, and showcases of florist expertise. This way, users will feel informed and reassured at every step, rather than concentrating only on photorealistic previews.

User journey map

1 Browse Bouquets

Action & Screen: User picks up their phone and taps the app icon. They navigate to the bouquet creation/selection screen.

User Goal & Mindset:
Find a gift/Rowers.
"I want to see what's available and decide if I want to customize or pick a pre-made one."

2 Choose Bouquet

Action & Screen: The user selects the option to either browse pre-made designs or enter the customization flow (likely by tapping an option like "Start Customizing" or "Flowers').

User Goal & Mindset:
Begin the design process.
"I'm ready to look at options; I'll start with the flowers."

Action & Screen: The user selects the option to either browse pre-made designs or enter the customization flow (likely by tapping an option like "Start Customizing" or "Flowers").

User Goal & Mindset: Begin the design process. "I'm ready to look at options; I'll start with the flowers."

3 Choose Flowers

Action & Screen: The user interacts with the Flower Selection screen, tapping on verious flower options (like the ones shown under "Popular" or "All Flowers"). The main bouquet view updates with the selection.

User Goal & Mindset: Select the main floral components. "I like roses and lilies. How do they look together?"

Action & Screen: The user interacts with the Flower Selection screen, tapping on various flower options (like the "Fhowers").

User Goal & Mindset: Select the main floral components. "I like roses and lilies. How do they look together?"

4 Select Vase/Details

Action & Screen: The user moves through secondary customization screens (like Choose & Select Vase). They might also adjust colors or arrangement style at this stage. The preview updates again.

User Goal & Mindset:
Refine the look and arrangement.
"I need a nice vase for this. The tall, white one looks best."

Action & Screen: The user moves through secondary customization screens (like Choose & Select Vase). They might also adjust colors or arrangement style at this stage. The preview updates again.

Usor Goal & Mindset: Refine the look and arrangement. "I need a nice vase for this. The tall, white one looks best."

5 Place Order (Review)

Action & Screen: The user arrives at the Vase Summary & View screen. They review the final visual, check the Your Selection detalls, and examine the Price Breakdown.

User Goal & Mindset:
Confirm all details and pricing.
"Is this exactly what I ordered? Let me check the final cost before paying."

6 Final Order/ Checkout

Action & Screen: The user taps the "Place Order" button, leading them through the payment and confirmation screens.

User Goal & Mindset:
Complete the transaction.
"Everything looks good. Time to pay and finalize the delivery."

Action & Screen: The user taps the "Place Order" button, leading them through the payment and confirmation screens.

User Goal & Mindset: Complete the transaction. "Everything looks good. Time to pay and finalize the delivery."

Persona: Caroline

To easily design and purchase a beautiful, personalized flower bouquet for a special occasion.

ACTION	Discovery and start	Customisation of flowers	Select vase	Review and confirm	Order Summary
TASK LIST	A. Open app and explore options B. Explore the ‘Create your own bouquet.” C. View the preview	A. Browse through different flower categories (e.g., Roses, Lilies). B. Read the details, prices, and descriptions of specific flowers. C. Select and add desired flowers to the arrangement.	A. Swipe through different vase materials and styles (Glass, Ceramic). B. View how the selected vase changes the overall look of the bouquet. C. Confirm the vase selection and proceed.	A. Review the itemized list of chosen flowers and the vase. B. Check the total price breakdown (including delivery fees). C. Type out a personalized gift message.	A. Enter delivery address and delivery date. B. Input payment details. C. Tap "Proceed to Checkout" and view the success screen.
EMOTIONS	Seemed delighted and optimistic	Inspired and creative, but potentially a little overwhelmed by the sheer number of options.	Confident and satisfied seeing the final physical form come together.	Excited, but slightly cautious while double-checking the final price.	Relieved, happy, and eager for the delivery.
IMPROVEMENT OPPORTUNITIES	Area to improve Loading speed	Add a "Filter" option (by color, season, or price) so she can narrow down choices faster.	Add a feature that automatically recommends the best vase size based on the number of flowers she picked.	Ensure the text box for the gift message clearly shows a character limit so she doesn't write too much and get an error.	Include quick payment options like Apple Pay or Google Pay so she doesn't have to manually type her credit card number.

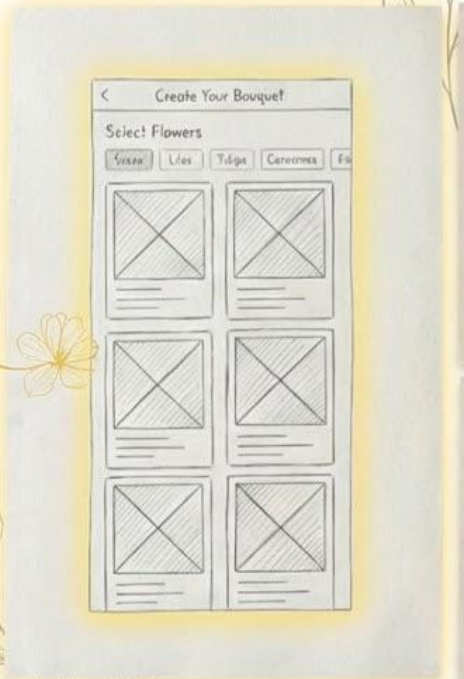
Starting the design

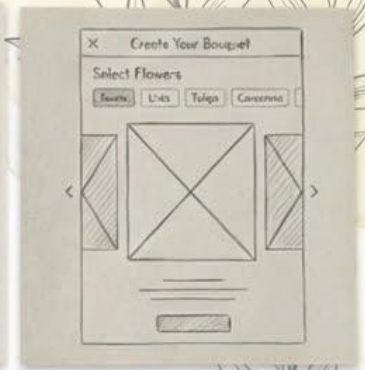
- Paper wireframes
- Digital wireframes
- Low-fidelity prototype
- Usability studies

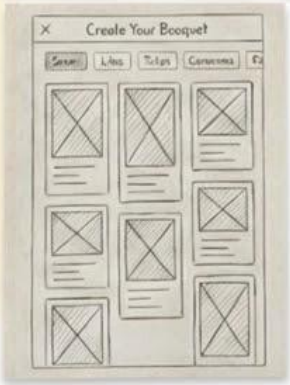
Paper wireframes

Goal: Explore multiple layout options for the primary "Select Flowers" screen to find the best balance between visual appeal and efficiency.

Thought Process: I sketched five distinct variations, ranging from a text-heavy list view to a visual-heavy carousel. I ultimately prioritized the **2-column grid layout** (seen on the far left) because it allows users to scan multiple flower options quickly while still keeping the images large enough to verify quality.





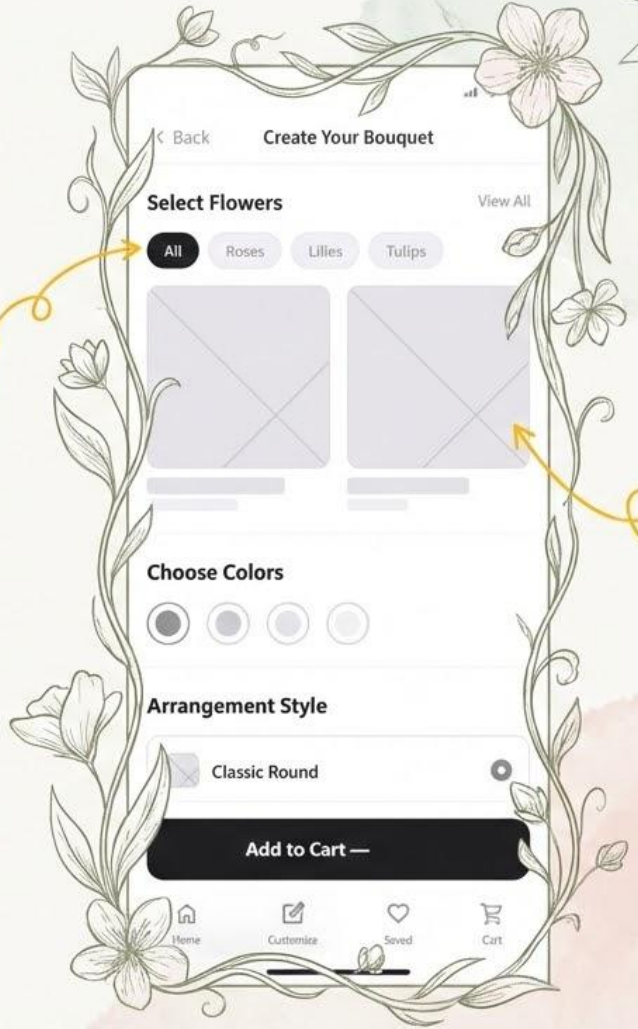


Digital wireframes

Goal: Streamline the flower selection process to prevent user overwhelm.

Thought Process: I moved from a simple list (in my initial sketches) to a 2-column grid layout. This maximizes screen real estate, allowing users to see more flower options at once while keeping the images large enough to verify quality details.

Element: Categorized filter chips at the top.
Benefit: Allows users to quickly narrow down choices by flower type, reducing the cognitive load of scrolling through a long "All Flowers" list.



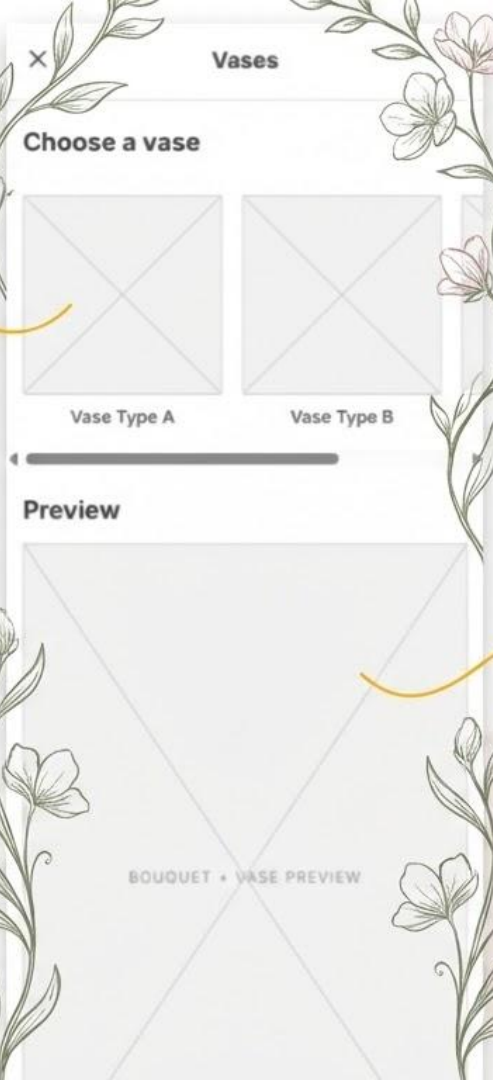
Element: Large selection cards with clear labels.
Benefit: Provides a visual preview of the flower, ensuring users are confident in what they are selecting before they move to the

Digital wireframes

Goal: To provide immediate visual confirmation and reduce user anxiety about how the final arrangement will look.

Thought Process: I wanted to move beyond a simple list of vase names. By adding a dynamic preview window, the user can see their selected flowers inside the selected vase instantly. This mimics the in-store experience of holding a vase up to a bouquet.

Description: Visual selection cards for vase material.
Benefit: Uses clear thumbnails rather than just text labels, making it faster for users to identify the style that matches their taste.



Description: Dynamic product preview area.
Benefit: Acts as a "system status" update, reassuring the user that their two choices (flowers + vase) work well together aesthetically.

Low-fidelity prototype

Flow 1: Custom Bouquet Order

This is a straightforward, linear "happy path" guiding a user from landing on the app to finalizing a custom flower purchase.

1. Homepage: The journey begins on the welcome screen. The user taps the primary "Get Started" button to initiate the order.

2. Customization: The user lands on the main building hub where they can see their bouquet preview and categories.

3. Flower Selection: A detailed browsing screen where the user can view prices and select specific blooms.

4. Select Vase: After choosing flowers, the user is prompted to select a container style and taps "Select & Continue".

Order Summary: The final screen acts as the checkout cart, displaying the itemized cost breakdown and "Proceed to Checkout" button.

Google

Usability study: findings

Write a short introduction to the usability studies you conducted and your findings.

Round 1 findings

1. The new 'Filter Tabs' (Roses, Lilies, etc.) were successful, but users requested a 'Clear All' option.

2. The pricing text on the 'Order Summary' screen was too small and difficult to read for some participants.

Round 2 findings

1. Users appreciated the vase preview but wanted the ability to zoom in on the final arrangement image.

2. Users struggled to find specific flower types in the initial long scrolling list, indicating a need for better categorization.

3. Participants were unsure if their flower selections were being saved, requesting clearer 'Added' feedback.

4. Users wanted to select a vase earlier in the process (before checkout) to visualize the final gift.

Google

Refining the design

- Mockups
- High-fidelity prototype
- Accessibility

Mockups

Goal:
Complete s:tha:approchonnmic compizintory measurer long scrolling flowers.

Thought Process:
Determine the flower mat'o to:rm:ard new sticky category should implemented snakanc logical mootly cognitive 'mvicies and lists.

Feedback:
Feedback reovegineo intuated that therjre sticky category bar jitre:omennings.

Refinement:
Develop and enhags a refinement alut to sticky category bar list continue &:r:ataminite.

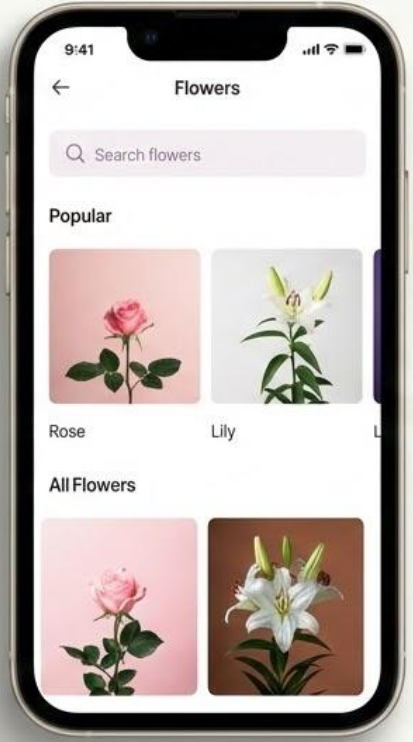
Result:
The app small result is concent to the new sticky category bar to manitor the adults.

Before usability study

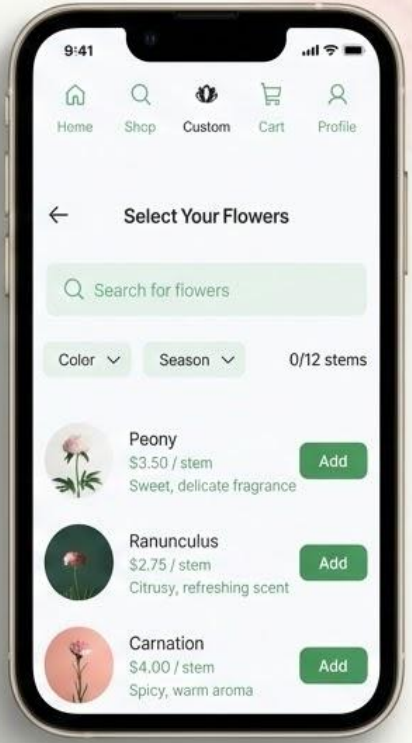
After usability study

Mockups

Before usability study



After usability study



Feedback: Participants in the initial study weren't sure if tapping a photo added the flower to the cart or just opened a details page.

Refinement: I added distinct "Select" buttons and a visible counter (e.g., "0/12 stems selected") to provide immediate system status feedback.

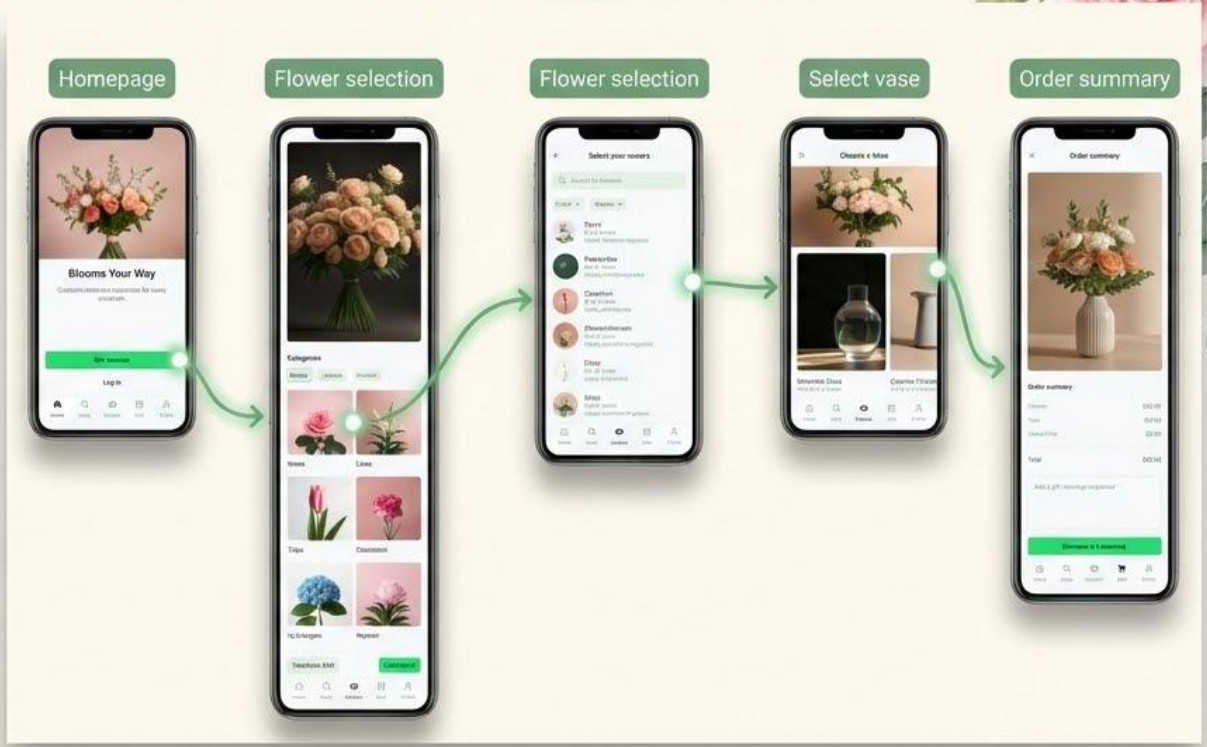
High-fidelity prototype

[View Figma Prototype (Botique App)]



Accessibility considerations

1

Dark
Colors
Palete

I used high-contrast colors for all text and background combinations, ensuring that product names and prices are legible for users with low vision.

2

All images include detailed alt text (e.g., "Red roses in a glass vase"), allowing screen reader users to visualize the bouquet options through description.

3

Button

I designed large touch targets (48x48 px min) for all interactive buttons and used clear headings to help users with motor impairments navigate the flow easily.

Google

Going forward

- Takeaways
- Next steps

Takeaways

Impact:

> *"I finally feel confident ordering flowers online because I can see exactly what I'm getting."* — Usability Study Participant.

Our usability updates (specifically the new filter tabs and vase preview) significantly reduced user hesitation. In a real-world scenario, we project this transparency would lead to a higher conversion rate and fewer abandoned carts at checkout.

What I learned:

I learned that even small visual changes—like adding a simple "Add" button or a category filter—can have a massive impact on user confidence.

I also discovered that "high fidelity" isn't just about making things look pretty; it's about providing the visual details (like pricing and product previews) that users need to trust the system.

Google

Next steps

Validate & Refine

Conduct another round of usability testing on the final high-fidelity prototype to validate changes (like new “Add” buttons and vase preview) and statistically improve the success rate.

Recurring Delivery Feature

Explore and design a subscription model for anniversaries to increase user retention and customer lifetime value, as requested in user research.

Design System & Handoff

Create a formal design system for developer handoff and conduct an accessibility audit with screen readers (like NVDA/VoiceOver) to ensure implementation matches design intent.
